

December 2001 Mac OS X Developer Tools Update

The December 2001 Developer Tools Update release contains updates to Project Builder and FileMerge. It is intended for use with systems which already have the December 2001 Developer Tools installed. This update is NOT a full release of the Mac OS X Developer Tools.

The Update contains two Installer packages; you may install either package or both of them, depending upon your needs. The "DebuggerPatch" package installs a patch to Project Builder which fixes a crash that can happen during debugging. This crash happens most frequently when viewing lots of files during a debugging session. (A CrashReporter log of the crash shows a stack with a frame containing the method: "-[PBXDebugSessionModule setInstructionPointerFileName:lineNumber:]").

The second package is "FileMergeUpdate" and installs a new FileMerge application which fixes a problem in which the resulting merged file can become corrupted when merging with an ancestor file.
